

The Texas Hold'em Equity Calculator calculates the equity of two hold'em hands in a preflop all-in confrontation. For instance, if the pot size is 100 and the equity of one hand is 57 %, then the expected value of that hand is $0.57 * 100 = 57$.

Enter hands in the format *rsrs*, where $r \in \{A, K, Q, J, T, 9, 8, 7, 6, 5, 4, 3, 2\}$ and $s \in \{c, d, h, s\}$ (case insensitive). For example, AdTc would represent the hand ace of diamonds, ten of clubs.

The number of boards dealt can be changed under options -> trials. Increasing the number of trials provides better accuracy, while decreasing improves performance. Enter a number between 1000 and 500000.
